Test Conducted

The RoHS screening analysis is performed by an Ed-XRF (energy dispersive X-ray fluorescence) analyzer. The analyzer determines the chemistry of a screened component by measuring the spectrum of characteristic X-ray emitted by different elements in the sample, which subjected to X-ray radiation. In the way the analyzer is able to determine which element in the periodic system that is present in screened components.

Determination of total value of regulated substances in electro technical products, elements of cadmium (Cd), lead (Pb), mercury (Hg), chromium (Cr) and bromine (Br) content were measured by XRF spectroscopy for RoHS restricted substances. The analyzer is therefore unable to determine if it is PBB, PBDE, Cr(VI) or non restricted bromine and chromium substances in the sample.
